## SPRING 2018

Our Perendale and Perendale/Texel flock ewes we select our replacement ewe lambs from, taking them right out on top at the back of our hill the beginning of the last week in September. The snow was melting and the forecast was okay but it was a concern to be leaving them up there knowing they had just walked 2kms & climbed 500 metres carrying multiples and were about to start lambing. This was followed by several other snow falls during October and some very hard frosts. So it was a real relief when we went up to tail to find the pigs had stayed away this year and the survival had been good considering we had some toxo abortions as well because of the huge challenge the large numbers of wild cats which live on rabbits. Relief to find the number of ewes put into each block at the beginning of lambing verses the number of lambs tailed averaged 192%. Exactly the same as two years ago. Also most pleasing, the quality of the lambs, there was only one lamb I wanted to call the neighbours. The policy with this mob is the same as in the stud mob, at scanning time any ewe carrying a single gets a black tag and is put in the terminal mob and stays there for the rest of its life. If you are serious about lifting you're your lambing % I would encourage you to have the same policy. By having a terminal mob which go to the Suffolk/Texel we are able to get a very good 18kg weaning draft the first week in January when they are still very young lambs, this then frees up the feed to grow out your replacements which are all multiples. In the stud ewe mob we have now had this policy for 28

years. So the Perendale/Texel rams for sale this year have 28 years of no singles in their background.

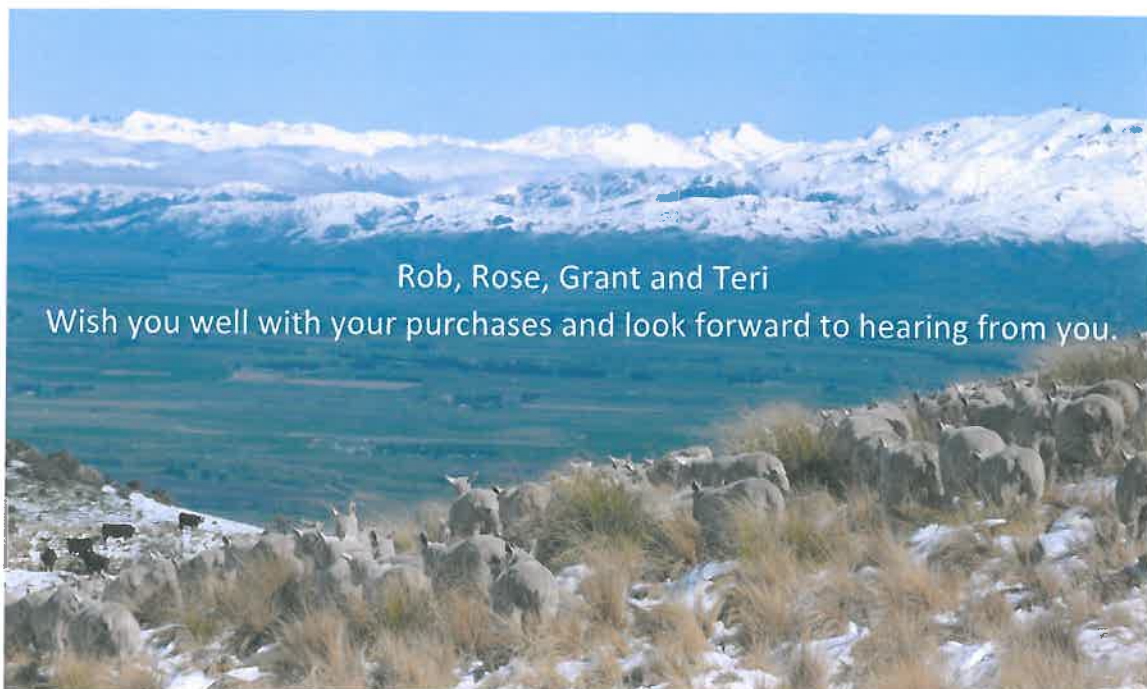

Also most pleasing was when we Carla saliva tested this years rams, 89% had medium or high results with several having very high readings. The Carla antibody in the saliva destroys the coating of the internal parasite larvae when the animal is eating grass and chewing its cud, once that coating is destroyed the larvae is no longer viable and passes through the animal. What is also interesting is the Carla test is the only accurate measurement for internal parasite resistance in deer.

The Suffolk/Texel Ewes – Lamb completely unassisted on the tussock block. From when they are put in that block before lambing right through until they are penned for tailing they never see a person. Ram clients can be assured that these are very much easy-care sires with high survival breeding behind them. At tailing time when we tag the lambs we estimate whether they were born the 1<sup>st</sup>, 2<sup>nd</sup> or 3<sup>rd</sup> week of lambing so that all production data (liveweight, EMA etc) can be corrected for age and rank so that clients can then make a valid comparison between animals. Because each breed is run on separate parts of the property comparisons between breeds can't be made.

Adj LW – Liveweight corrected for age, birth and rearing rank.

Adj EMA – Eye Muscle Area, taken half way along the loin, corrected for age, birth and rearing rank.

Adj C – Depth of fat at scan site halfway along the loin, corrected for weight.  
NB. This isn't their GR measurement. Only take this into account if fat is a problem for you.

Full SIL data for the Texel rams will be on each pen the day of the auction.

Rams will be penned at 9.30 a.m.

Sale starts at 11 a.m.

Lunch will be available at the conclusion of the sale but will be available earlier for those that can't stay till the conclusion of the sale.

For those clients who cannot attend on the day of the sale but wish to purchase rams then please contact **Peter Walsh & Associates incorporating South Stock** or any of the following who will be in attendance:
